

(a)  $f(x) \approx \delta(x)$  (narrow Gaussian)  $f(x)$

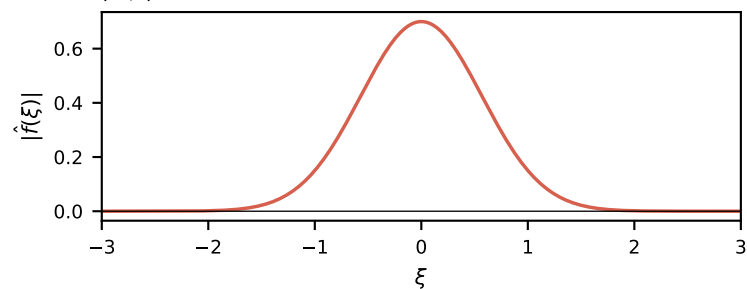

$|\hat{f}(\xi)| \approx 1$  (flat)

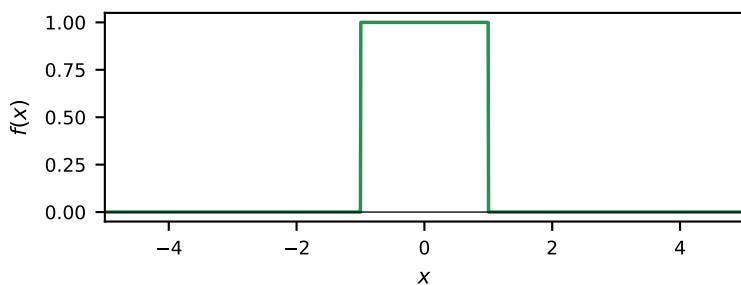

(b)  $f(x) = e^{-\pi x^2 / \sigma^2}$ ,  $\sigma = 0.7$

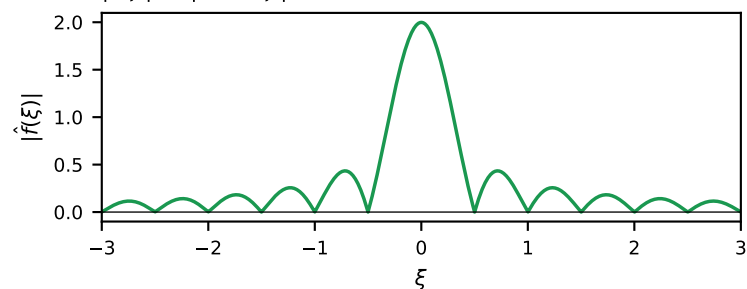

$|\hat{f}(\xi)| = \sigma e^{-\pi \sigma^2 \xi^2}$  (broader Gaussian)

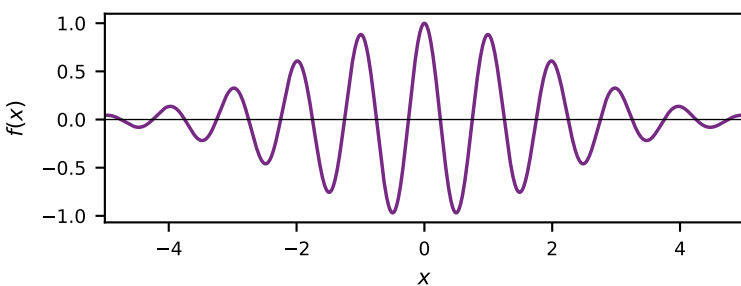

(c)  $f(x) = \text{rect}(x/L)$ ,  $L = 2$

$|\hat{f}(\xi)| = L |\text{sinc}(L\xi)|$

(d)  $f(x) = \cos(2\pi \xi_0 x)$  (windowed),  $\xi_0 = 1$

$|\hat{f}(\xi)|$ : two spikes at  $\pm \xi_0$
